

**In the Specification:**

Please amend the specification as follows:

Page 7, first paragraph:

Figure 4 shows an alternative embodiment of the solder head. In this embodiment, a compression spring 27 is arranged between the turning device 25 and the shaft 22. When the relative axial movement is not blocked, the contact pressure between the active tip 26 and the capacitor element 140 will be determined by the total weight of the solder tip 21, the shaft 22 and the compression spring 27 and by the friction in the bearing box 23 plus the compression of the compression spring. This type of suspension is here designated "floating suspension with compression spring".
